VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or VCAM-1 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic agents. IA4B1 also recognises the extracellular matrix glycoprotein
                                                                                                                                New peptide(s) based on the LDV domain of fibronectin - unhibiting binding of alpha-4, beta-1 integrin to VCAM-1 fibronectin or invasin
                                                                                                                                                                      WPI;

                       AAW25187-W25192 are peptides containing an LDV sequence or equivalent. The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic operations. Preferred irrigation solutions are electrolyte-free and contain 1 microg/ml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, IDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.
                                                                                                                                                                             Claim 6;
                                                                                                                                                                                                      adhesion
                                                                                                                                                                                                                     Endoscopic irrigation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CSI and CS5) are present in the alternatively spliced type III connecting segments. CSI has the higher affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CSI peptide that include the LDV domain presented in such a way by its nove; flanking sequence to produce a potent inhibitor of IA4B1 binding.

                                                                            ş
                                                                                                                                                                               The present sequence is a linear stretch of amino acids (present in fibronectin) recognised by the integrin alpha4betal. Integrins are cell surface receptors. The penton base protein (one of the coat proteins) of adenoviruses binds to integrins. The integrins not only provide a binding site for the adenovirus penton base protein, but also mediate cellular adhesion to the extracellular matrix molecules. The specification describes a method of introducing an adenovirus into a cell in vitro having a particular cell surface binding site. The adenovirus is contacted with a bispecific molecule comprising a component that selectively binds a binding domain of the penton base protein of the adenovirus and a second component that selectively binds the cell surface binding site. A complex of the adenovirus and the cell is contacted with it to allow entry of the adenovirus into the cell. The methods can be used for research and the vectors can be used for gene therapy.
                                                                                                                      Query Match

thrombus may form an occlusion of a blood vessel, in a subject comprises cadministering a compound which dissociates fibrinogen bound to a first site on platelet glycoprotein IIb-IIIa, by binding to a second interacting site on platelet glycoprotein IIb-IIIa, disaggregating the platelet thrombus. The method is used to treat humans with unstable angina, stroke and/or acute myocardial infarction. The methods can be used to enact de-adhesion of osteoclasts from the bone surface to halt bene loss in a patient with osteoporosis. The methods can also be used for the de-adhesion of angiogenic endothelial cells in a patient with a condition associated with angiogenesis, e.g. cancer, diabetic retinopathy, psoriasis. The methods can also be used to treat tumours, atherosclerosis, inflammatory conditions, e.g. arthritis, inflammatory cowel disease, or organ transplant rejection, and asthma. The methods can be used for the dissolution of pre-formed platelet aggregates, which is a departure from the current strategy of treatment prior to formation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of treatment priors and inflammation of the current strategy of the prior to formation of the current strategy of the prior to formation of the current strategy of the prior to formation of the current strategy of the prior to formation of the current strategy of the prior to formation of the current strategy of the prior to formation of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to integrin ligand dissociators. Disaggregation of an existing platelet thrombus in a blood vessel is due to dissociation of fibrinogen from glycoprotein IIb-IIIa. This dissociation is caused by the binding of an integrin-ligand dissociator at ligand binding site I of glycoprotein IIb-IIIa. The invention provides a method of disaggregating an existing platelet thrombus in a blood vessel, where the platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Integrin-ligand; dissociator; disaggregation; platelet thrombus; stro fibrinogen; glycoprotein IIb-IIIa; angina; myocardial infarction; bon osteoclast; osteoporosis; angiogenesis; cancer; diabetic retinopathy; psoriasis; tumour; atherosclerosis; inflammatory bowel disease; asthmorgan transplant rejection; arthritis; ILD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          03-SEP-1998;

                                                                                                                                                                                                                                                                                                                                                  metalloprotease inhibitors. The peptides AAY80466-Y80492 are claimed examples of cell adhesion peptides used in the system of the invention. The system is used to replace, remodel or correct bone defects, e.g. fractures, fissures or bone mass loss. Incorporation of (I) into the scaffold results in rapid seeding by osteoblasts and the development of an organic matrix, i.e. the preformed scaffold replaces the rate-determining step of extracellular matrix formation. The scaffold cape designed to have a predetermined resorption/degradation rate, and may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel system for reconstitution of osseous tissue comprising a scaffold carrying a compound (I) that promotes bone formation and a component that decreases bone resorption (II). (I) induces migration and adhesion of osteoblasts and osteoclasts and (II) inhibits proteolysis (specifically by plasmin) of extracellular matrix. (I) is preferably selected from: selection or selection binding

important role in the maturation and trafficking. VLA-4-mediated cleukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and conditions, such as asthma, rheumatoid arthritis, osteoarthritis and conditions, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, clear, multiple sclerosis), allergies, atherosclerosis, colitis, clear, multiple sclerosis), allergies, atherosclerosis, colitis, clear, inflammatory bowel disease, kidney inflammation and creating either in the constant of the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to
                                                          manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of

These are are integrin inhibitors, specifically of VLA-4 (very late antigen 4, also known as alpha-4-beta-1 or CD49d/CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytokine-inducible cell surface protein VCAM-1 (vascular cell adhesion molecula-1) and for the alternatively spliced forms of fibronectin (FN) which contain the CS-1 domain. The novel compounds inhibit cell adhesion, and consequent or associated pathogenic processes mediated by VLA-4, and may therefore be useful in the treatment and prevention of inflammatory, psoriasis, multiple sclerosis, treatment rejection, diabetes, and inflammatory bowel disease. Sequences AAY69618-Y6920 represent peptides derived from the VLA-4-binding domain of the FN CS-1 region which

The integrin antagonists that may be used in the method include antagonists of alpha-1-subunit containing integrins or antagonists of alpha-1-subunit containing integrins. In particular, the antagonists are antibodies specific for VLA-1 (very late antigen-1, alpha-1-beta-1 integrin) or specific for VLA-1 (very late antigen-1, alpha-1-beta-1 integrin) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating failure,
                                                                                                                  vIA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal fallure, end-stage renal disease, chronic diabetic nephropathy, diabetic glomerulopathy, diabetic renal hypertrophy, hypertensive nephrosclerosis, hypertensive glomerulosclerosis, chronic glomerulonephritis, hereditary nephritis or renal dysplasia. Sequences AAB73464-AAB73465 represent peptides derived from the VLA-4 binding domain (CS-1 region) of fibronectin, which inhibit fibronectin-dependent cell adhesion, and may

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a creative group (II) (e.g. succinimidy) and maleimido groups) attached to a comprising a therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the examplification of the present invention.

               AAB59135
                                                                                                                                          Q
                                                                                                                                                                                                                                                                                               RESULT
                                                                                                                                                                                                                                                                                                                                               The present sequence is given in a specification relating to a complete comprising a series of heptad-repeats that mimic a transmembrane domain, and a selected cytoplasmic domain attached to the heptad repeats. At least a portion of the polypeptide is prepared recombinantly or at least 1 heptad repeat in the series has a different amino acid sequence to other heptad repeats in the series. The collypeptide is useful in the construction of structural models which are useful for evaluating structure and activity of a selected occupied and collustered transmembrane protein having the selected cytoplasmic domain and for identifying the appendix in the graph of a coupled and collustered transmembrane protein having the selected cytoplasmic domain and for identifying agents as inhibitors of alpha4 integrin biological responses by contacting the structural model with paxillin or a paxillin or a paxillin or a paxillin related molecule to the structural model. A decrease in binding in the presence of the test agent and test agent indicates that the test agent is an inhibitor of alpha4 integrin collopical response. Inhibitors of the binding of paxillin to alpha4 are useful in blocking immune responses in conditions such as inflammatory to bowel disease, arthritis, multiple sclerosis and asthma and in the binding in the presence of a part of the binding of paxillin collopical responses.

It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation, thromboate and mailtaneous.

                                                             The invention relates to peptidominetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-be CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice varian the extracellular matrix protein fibronectin (FN). VLA-4 is express the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a leukocyte adhesion to the CS-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
This invention describes a novel method for the cyclization of penta- of hexapeptides which is effected by reaction with propanesulfonic acid anhydride (I). The process is especially useful for cyclizing H-Phe-D-Trp-Ala-Thr(tbu)-Phe-Pro-OH to obtain the somatostatin agonist L-363,301, or for cyclizing H-Ile-Leu-Asp(OtBu)-Val-NH(CH_2)_5COOH. The process gives higher yields than prior art processes. This sequence

                                 active participant in leukocyte trafficking functions. Binding of inflammatory cells to endothelial cells that express the CS-1 portion (AAW01703) of fibronectin on their surfaces can be inhibited by CS-1 peptidomimetic cpds. of minimal length. A minimal essential sequence for specific VLA-4 recognition of CS-1 has been identified as the tripeptide LDV. A generic peptidomimetic inhibitis the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an aq. buffer at a pH value of 7.2-7.4 to an extent that is equal to crupto about 3000-fold greater than the inhibition in the binding exhibited by AAW01705. CS-1 mediated inflammation, e.g. asthma, buffer at a pH value of 7.2-7.4 to an extent that is equal to carbonic by AAW01705. CS-1 mediated inflammation, e.g. asthma, buffer at a contraction control of the binding exhibited by AAW01705. CS-1 mediated inflammation, e.g. asthma, buffer at a control of the binding exhibited by AAW01705. CS-1 mediated inflammation, e.g. asthma, buffer at a control of the binding exhibited by AAW01705. CS-1 mediated inflammation, e.g. asthma.

                                                                                                                                                                   The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothellal cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system
                                        (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to
                                                                                                                                                                                                                                                                                                                                                                                                                      expressing receptor and VLA-4 inhibitors cardiovascular disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;

The invention relates to peptidomimetic compounds (AAY77415-Y77438) CC capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CC CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of CC the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on CC important role in the maturation and trafficking. VLA-4 -mediated 1 eukocyte adhesion to the CS-1 FN/VLA-4 interaction plays an CC critical step in the inflammatory response. The peptidomimetics of the CC critical step in the inflammatory response. The peptidomimetics of the CC conditions, such as asthma, rheumatoid arthritis, osteoarthritis and CC allograft rejection. They may also be used to treat psoriasis and other CC skin inflammations, demyelinating diseases of the central nervous system CC (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, CC diabetes, inflammatory bowel disease, kidney inflammation and CC involves the use of anti-VLA-4 antibodies, which can themselves induce an composition of vLA-4/CS-1 interaction either common or prepared administration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

                                                              The present peptide is a specifically claimed example of a peptide which contains the highly generic sequence AA5-AA4-AA3-AA2-AA1-(AAX)n where AA5 is Glu, Ser, Asp or Asn; AA4 is Leu or Ser, AA3 is Leu, Ile, Phe or Gly, Pro or Asp; AS or Ser; AA1 is Gly, Pro or Asp; AAX is any amino acid and n = 0 or 1. When two or more such peptides are attached to a carrier, the product can be used for stimulating adhesion of eukaryotic cells in vitro. Particular applications include coating synthetic blood vessels with endothelial cells, preparing skin grafts using epithelial cells or stimulating wound healing. When a single peptide is used it may inhibit intercellular adhesion, making the period of the per
it useful for preventing thrombosis or arteriosclerosis or to suppress cancer metastases. The peptides can also be used as chemotactic attractors and for detecting/quantifying cell-cell adhesion in vitro.

                                                                                       tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic agents. IA4B1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IA4B1-binding sites have been identified within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                       Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or VCAM-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT
                                          Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAAB1; or VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAAB1; or VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAAB1; or VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAAB1; or VCAM-2 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IAAB1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, caussing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic agents. IAAB1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IAAB1-binding sites have been identified within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IAAB1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 and CS1 the that include the LDV domain presented in such away by its novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                   this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic agents. IA4B1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IA4B1-binding sites have been identified within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IA4B1 and contains the tripeptide LDV as its minimal active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or VLA-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a precursor peptide. The invention relates to cyclic peptides which block the interaction of protein ligand VCAM-1 (vascular cell adhesion molecule-1) to its integrin receptor VLA-4 (very late antigen-4), thereby modulating T-cell proliferation, B-cell localisation to germinal centres and adhesion of activated T-cells and eosinophils to endothelial cells. These peptides are thus of use in treating diseases associated with these processes, including rheumatoid arthritis, multiple sclerosis and asthma, melanoma cell invasion in metastasis, autoimmune diabetes, colitis, autoimmune encephalomyelitis, atherosclerosis, peripheral vascular or cardiovascular disease, nephritis, allograft rejection, psoriasis, restenosis, myocarditis, and inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cyclic octa:peptide comprising dimeric tetra:peptides joined by two peptide mimetic linking gps. - block interaction of VCAM-1 and/or fibronectin with integrin VLA4, used in treating arthritis, asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cyclic peptide; dimeric peptide; vascular cell adhesion molecule-1; VCAM-1; fibronectin; integrin; rheumatoid arthritis; asthma; multiple sclerosis; VLA-4; very late antigen-4; precursor.

                                                                                                                             RESULT
                                                                                                                                                                                                                                                                                                                                                            the angiopoietins through cleavage by the proteases TPCK Trypsin or Staphylococcus aureus protease. The angiopoietins bind to the receptor tyrosine kinase Tie-2 which is upregulated during angiogenesis. The angiopoietins bind to the receptor tyrosine kinase Tie-2 which is upregulated during angiogenesis. Angiopoietin 1 (Ang 1) is ubiquitously expressed and interacts with Tie-2 on endothelial cells and early haemopoletic cells. Angiopoietin 2 (Ang 2) is homologous to Ang 1 and competitively inhibits Ang 1 creating interaction with Tie-2. Angiogenesis is the process involved in creating a blood supply to a tumour. The peptides are used in a compound that binds to sites of angiogenesis. The compound consists of a chelator moiety capable of complexing a radionuclide metal or a moiety capable of binding to a halogen group, and an angiogenesis targeting molecule. The peptides are incorporated in the angiogenesis targeting molecule. The compounds are used for imaging and treating angiogenesis, and also to detect, stage and treat tumours and metastases. Angiogenesis is also required for wound healing and conditions such as diabetic retinopathy, in the treatment of these conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      19-AUG-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligopeptides containing the amino acid sequences: RGD, LDV, IDA, DGI GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                osteonectin etc.. These peptides can be incorporated into the biomaterial when they are designed with a strong nucleophile in the peptide chain such as cysteine. These peptides are potentially useful in controlling a variety of cellular reactions such as cell attachment, migration and overgrowth on a material surface when the material in controlling and overgrowth on a material surface when the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  unsaturated bond or a conjugated unsaturated group, by nucleophilic addition. The polymeric hydrogels can be used in a variety of applications. They can be used to deliver therapeutic molecules to a subject, as adhesives or sealants (e.g. sealing air leaks on the lung), as tissue engineering and wound healing scaffolds, and as cell transplant devices. The biomaterials are also useful for adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity

       (AAW01703) of fibromectin on their surfaces can be inhibited by CS-1 peptidomimetic cpds of minimal length. A minimal essential sequence for specific VLA-4 recognition of CS-1 has been identified as the tripeptide LDV. A generic peptidomimetic inhibits the binding of Jurkat cells (ATCC TIB 152) to a solid phase-bound CS-1 peptide in an in vitro assay in an aq. buffer at a pH value of 7.2-7.4 to an extent that is equal to or upto about 300-fold greater than the inhibition in the binding exhibited by AAW01705. CS-1 mediated inflammation, e.g. asthma, rheumatoid arthritis, osteoarthritis, allograft rejection, skin
                                                                                                                               The alpha-4 beta-1 (CD49d/CD29, VLA-4) cell adhesion receptor active participant in leukocyte trafficking functions. Binding inflammatory cells to endothelial cells that express the CS-1;
                                                                                                                                                                                                             New peptide mimics of fibronectin CS-1 sequence - inhibit interaction of endothelial cells and VLA-4 carrying inflammatory cells, for treating or preventing asthma, arthritis etc.

                                                                                                                                                                    CC vascular cell adhesion molecule-1 (VCAM-1) is protein found on the CC surface of endothelial cells that line the interior wall of capillaries. CC vCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC what for very late antigen-4), a heterodimeric protein present on the Surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows CC white blood cells to adhere to the capillary wall in areas where the CC tissue surrounding the capillary has been infected or damaged. Sometimes CC this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, caussing widespread tissue damage. CC to capable of blocking this process may be beneficial as therapeutic CC agents. IA4B1 also recognises the extracellular matrix glycoprotein CC fibronectin. Three distinct IA4B1-binding sites have been identified CC within fibronectin. One site is found in the Hepli region and is CC expressed in all isoforms; two others (CS1 and CS5) are present in the CC affinity for IA4B1 and contains the tripeptide LDV as its minimal active Site. Peptides AAR95704-805 are modeled after a portion of the CS1 CC flanking sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-JUL-1994;

white blood cells to adhere to the capillary wall in areas where the CC tissue surrounding the capillary has been infected or damaged. Sometimes CC this white blood cell migration can become uncontrolled, with white blood cell migration can become uncontrolled, with white collowed cells flooding to the scene, causing widespread tissue damage. CC clos. capable of blocking this process may be beneficial as therapeutic agents. IA4B1 also recognises the extracellular matrix glycoprotein CC fibronectin. Three distinct IA4B1-binding sites have been identified within fibronectin. One site is found in the Hepli region and is expressed in all isoforms; two others (CS1 and CS5) are present in the CC alternatively spliced type III connecting segments. CS1 has the higher CC alternatively spliced type III connecting segments. CS1 has the higher CC affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 contains the contains the contains are modeled after a portion of IA4B1 binding.

VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAAB1) or VLA-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VCAM-1; vascular cell adhesion molecule-1; VLA-4; very late antigen-4; inhibitor; binding; white blood cell; migration; capillary wall; tissue damage; injury; fibronectin; extracellular matrix glycoprotein;

CC Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the CS surface of endothelial cells that line the interior wall of capillaries. CC VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IA4B1; or CC VLAA-4 for very late antigen-4), a heterodimeric protein present on the Surface of certain white blood cells. Binding of IA4B1 to VCAM-1 allows CC white blood cells to adhere to the capillary wall in areas where the CC tissue surrounding the capillary has been infected or damaged. Sometimes CC this white blood cell migration can become uncontrolled, with white CD blood cells flooding to the scene, causing widespread tissue damage. CC CDds. capable of blocking this process may be beneficial as therapeutic agents. IA4B1 also recognises the extracellular matrix glycoprotein CC fibronectin. Three distinct IA4B1-binding sites have been identified CC within fibronectin. One site is found in the Hepli region and is CC expressed in all isoforms; two others (CSI and CS5) are present in the CC alternatively spliced type III connecting segments. CSI has the higher CC affinity for IA4B1 and contains the trippetide LDV as its minimal active CC site. Peptides AAR93704-805 are modeled after a portion of the CS1 contains the LDV domain presented in such a way by its novel CC flanking sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                                                       Query Match

     Peptidomimetic compds. are disclosed that inhibit the binding between the
     VLA-4 and the fibronectin CS-1 compd. Pharmaceutical compns. contg. a
     contemplated compd. and methods for treating immunoinflammatory conditions
     using the compd. are also disclosed.
     fibronectin CS1 VLA4 binding inhibitor peptidomimetic; immunoinflammatory

    The present invention relates to novel peptide derivs. that are useful for
AΒ
    inhibition and prevention of cell adhesion and cell adhesion-mediated
    pathologies. This invention also relates to pharmaceutical formulations
   comprising these compds. and methods of using them for inhibition and
    prevention of cell adhesion and cell adhesion-mediated pathologies. The
    compds. and pharmaceutical compn. of this invention can be used as
    therapeutic or prophylactic agents. They are particularly well-suited for
    treatment of many inflammatory and autoimmune diseases. Thus, coupling of
     4-(2-MeC6H4NHCONH)C6H4CH2CO2H (prepn. given) with protected peptide
    H-Leu-Asp(OCH2Ph)-Val-OCH2Ph (prepn. given), followed by catalytic
    hydrogenolysis, gave cell adhesion inhibitor peptide 4-(2-
    MeC6H4NHCONH)C6H4CH2CO-Leu-Asp-Val-OH (I). All 408 prepd. peptide
    derivs., including I, inhibited VLA4-dependent adhesion to a bovine serum
    albumin conjugate with H-Cys-Tyr-Asp-Glu-Leu-Pro-Gln-Leu-Val-Thr-Leu-Pro-
    His-Pro-Asn-Leu-His-Gly-Pro-Glu-Ile-Leu-Asp-Val-Pro-Ser-Thr-OH, with IC50
    values of <1 mM.

Novel dipeptide analogs I [X = CO2H, PO3H-, SO2R5, SO3H, OPO3H-, CO2R4; Y AΒ = CO, SO2, PO2; n = 0-2; R1 = optionally substituted alkyl, alkenyl, alkynyl, aryl-fused cycloalkyl, cycloalkenyl, aryl, aralkyl, aralkenyl, aralkynyl, alkoxy, alkenyloxy, aralkoxy, alkylamino, alkenylamino, alkynylamino, aryloxy, arylamino, N-alkylurea-substituted alkyl, heterocyclyl; R2 = H, aryl, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, aralkyl; R2NCR3 = heterocyclic ring; R3 = natural, unnatural, modified, or substituted amino acid side chain; R4 = optionally substituted aryl, alkyl, cycloalkyl, alkenyl, cycloalkenyl, alkynyl, aralkyl, H, heterocyclyl, heterocyclylcarbonyl, aminocarbonyl, amido, alkylaminocarbonyl, arylaminocarbonyl, acylaminocarbonyl, acyl; R5 = alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, aryl, aralkyl, aralkenyl, aralkynyl] are prepd. as compds. useful for inhibition and prevention of cell adhesion and cell adhesion-mediated pathologies. This invention also relates to pharmaceutical formulations comprising these compds. and methods of using them for inhibition and prevention of cell adhesion and cell adhesion-mediated pathologies. The compds. and pharmaceutical compns. of this invention can be used as therapeutic or prophylactic agents. They are particularly well-suited for treatment of many inflammatory and autoimmune diseases. Thus, .beta.-amino acid-contg. dipeptide II, prepd. by std. methods, displayed an IC50 of <50 nM in a cell adhesion inhibition assay.

    Disclosed is a method of treating fibrosis in a human or animal subject.
AΒ
    The method comprises administering to the subject an effective amt. of an
     antagonist, i.e. antibody, to VLA-4 integrin or fragment thereof.

- Integrin .alpha.4.beta.1 on the surface of T lymphocytes interacts with AΒ vascular cell adhesion mol.-1 (VCAM-1) and fibronectin during migration of lymphocytes from the blood to sites of inflammation. Migrating lymphocytes actively modify their environment through a no. of mechanisms including proteolysis of the extracellular matrix by matrix metalloproteinases (MMP) synthesized by the cells. In this study, expression of MMP upon .alpha.4.beta.1-mediated adhesion of leukocytes to two major ligands, the IIICS-1 domain of fibronectin and VCAM-1, has been examd. Adhesion of T lymphoblastoid Jurkat cells to the CS-1 peptide induced expression of mRNA for two MMPs, gelatinase A (MMP-2) and gelatinase B (MMP-9). As evaluated by relative RT-PCR and Northern blot analyses, the level of mRNA was upregulated about 4- to 5-fold for both MMPs compared to control cells maintained in suspension. With time, both enzymes were detected in conditioned media and inside the cells, and their identities were verified by Western blotting and gelatin zymog. Adhesion of Jurkat cells to the second major .alpha.4.beta.1 ligand, VCAM-1, upregulated mRNA for MMP-2 (3.5-fold) and failed to induce expression of mRNA for MMP-9. Accordingly, only MMP-2 protein was detected in conditioned media of cells adherent to VCAM-1. Occupancy of .alpha.4.beta.1 on the surface of suspended cells with sol. CS-1 peptide or VCAM-1 did not upregulate synthesis and release of MMPs. A similar pattern of induction of MMPs after adhesion to CS-1 and VCAM-1 was obsd. in T lymphocytes isolated from human blood. These results demonstrate that adhesion of T lymphocytes through .alpha.4.beta.1 to different ligands, which bind to similar or overlapping sites in the integrin, induces intracellular events leading to distinct patterns of MMPs biosynthesis. - Chlamydia are obligate intracellular eubacteria that are phylogenetically AΒ sepd. from other bacterial divisions. C. trachomatis and C. pneumoniae are both pathogens of humans but differ in their tissue tropism and spectrum of diseases. C. pneumoniae is a newly recognized species of Chlamydia that is a natural pathogen of humans, and causes pneumonia and bronchitis. In the United States, approx. 10% of pneumonia cases and 5% of bronchitis cases are attributed to C. pneumoniae infection. Chronic disease may result following respiratory-acquired infection, such as reactive airway disease, adult-onset asthma and potentially lung In addn., C. pneumoniae infection has been assocd. with atherosclerosis. C. trachomatis infection causes trachoma, an ocular

```
infection that leads to blindness, and sexually transmitted diseases such
as pelvic inflammatory disease, chronic pelvic pain, ectopic pregnancy and
epididymitis. Although relatively little is known about C. trachomatis
biol., even less is known concerning C. pneumoniae. Comparison of the C.
pneumoniae genome with the C. trachomatis genome will provide an
understanding of the common biol. processes required for infection and
survival in mammalian cells. Genomic differences are implicated in the
unique properties that differentiate the two species in disease spectrum.
Anal. of the 1,230,230-nt C. pneumoniae genome revealed 214 protein-coding
sequences not found in C. trachomatis, most without homologues to other
known sequences. Prominent comparative findings include expansion of a
novel family of 21 sequence-variant outer-membrane proteins, conservation
of a type-III secretion virulence system, three serine/threonine protein
kinases and a pair of parologous phospholipase-D-like proteins, addnl.
purine and biotin biosynthetic capability, a homolog for arom. amino acid
(tryptophan) hydroxylase and the loss of tryptophan biosynthesis genes.

AΒ The present invention relates to novel lung cancer related polynucleotides, the polypeptides encoded by these polynucleotides herein collectively referred to as "lung cancer antigens," and antibodies that immunospecifically bind these polypeptides, and the use of such lung cancer polynucleotides, antigens, and antibodies for detecting, treating, preventing and/or prognosing disorders of the lung, including, but not limited to, the presence of lung cancer and lung cancer metastases. More specifically, isolated lung cancer nucleic acid molecules are provided encoding novel lung cancer polypeptides. Novel lung cancer polypeptides and antibodies that bind to these polypeptides are provided. Also provided are vectors, host cells, and recombinant and synthetic methods for producing human lung cancer polynucleotides,

polypeptides, and/or antibodies. The invention further relates to

diagnostic and therapeutic methods useful for diagnosing, treating, preventing and/or prognosing disorders related to the lung, including lung cancer, and therapeutic methods for treating such disorders. The invention further relates to screening methods for identifying agonists and antagonists of polynucleotides and polypeptides of the invention. The invention further relates to methods and/or compositions for inhibiting or promoting the production and/or function of the polypeptides of the invention.

AΒ
       The present invention contemplates a cyclic peptide that inhibits the
       binding between the VLA-4 receptor expressed on inflammatory leukocytes
       and the fibronectin CS-1 peptide expressed on endothelial cells that are
       involved in immunoinflammatory disease states. Pharmaceutical
       compositions containing a contemplated cyclic peptide and processes for
       treating immunoinflammatory conditions using a binding-inhibitory cyclic
       peptide are also disclosed.
CAS INDEXING IS AVAILABLE FOR THIS PATENT.

No. US 1989-402389, filed on 1 Sep 1989, now abandoned Utility DT Granted FS Primary Examiner: Feisee, Lila; Assistant Examiner: Gambel, Phillip EXNAM Townsend and Townsend and Crew LLP LREP CLMN Number of Claims: 9 ECL Exemplary Claim: 1 31 Drawing Figure(s); 17 Drawing Page(s) DRWN LN.CNT 2876 CAS INDEXING IS AVAILABLE FOR THIS PATENT. The present invention relates to a method for inhibiting the adhesion of AB one cell to another comprising interfering with the interaction between the extracellular matrix receptor and its ligand. The invention is based upon the discovery that the .alpha.4.beta.1 extracellular matrix receptor promotes adhesion of lymphocytes to endothelial cells via attachment to a defined peptide sequence. Prior to the present invention, the ligand of the .alpha.4.beta.1 receptor had

extracellular matrix receptor promotes adhesion of lymphocytes to endothelial cells via attachment to a defined peptide sequence. Prior to the present invention, the ligand of the .alpha.4.beta.1 receptor had not been identified, nor had the function of the .alpha.4.beta.1 receptor in lymphocyte attachment been known. By preventing the interaction between the .alpha.4.beta.1 receptor and its ligands using antibodies or defined peptide sequences, the present invention enables, for the first time, specific intervention in the migration of

lymphocytes through the vascular endothelium and into tissues. The present invention, therefore, has particular clinical utility in suppression of the immune response; in various specific embodiments of the invention, the adherence of lymphocytes to endothelium may be inhibited systemically, or may, alternatively, be localized to particular tissues or circumscribed areas. Accordingly, the present invention provides for treatment of diseases involving autoimmune responses as well as other chronic or relapsing activations of the immune system, including allergy, asthma, and chronic inflammatory skin conditions.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

The present invention is directed to an isolated and purified peptide comprising the LDV domain of the CSI peptide sequence or single amino acid substitutent analog thereof. A preferred peptide has the amino acid residue sequences shown in SEQ ID NOs:8-14, 17-23, 25, 28, and 51. The present invention is further directed to a process of inhibiting the binding of .alpha..sub.4 .beta..sub.1 integrin to a protein such as VCAM-1 or fibronectin comprising exposing a cell that expresses .alpha..sub.4 .beta..sub.1 integrin to the protein in the presence of an effective inhibiting amount of such a peptide. The present invention is still further directed to a pharmaceutical composition comprising a peptide of SEQ ID NO:8-102.
